ABSTRACT

This annual report presents demographic data on households and families for 1983 and highlights some important changes that have occurred in recent years. Nine pages of text precede the 25 detailed tables that compose the major portion of the report. This preliminary text provides an introduction and a user's guide to the tabular material. Briefly described are composition of households, change in household formation patterns, selected characteristics of households, one-parent families, years of school completed by family householders, homeownership, and related reports. Selected highlights of these discussions include the observations that (1) the number of households in 1983 (about 83.9 million) did not increase significantly over the number of households in 1982; (2) average household size dropped from 3.33 persons per household in 1964 to 2.73 persons per household in 1981, but no significant change in the average has occurred during the past 2 years; (3) one-parent families, as a percentage of all families with children, increased from 11 percent in 1970 to 22 percent in 1983; and (4) among all families with children, the proportion of householders completing 4 or more years of college in 1983 was 22 percent, as compared with 9 percent for female householders maintaining one-parent homes. Two appendices provide (1) term definitions and explanations of categories, and (2) information concerning source and reliability of estimates. (RH)

ACKNOWLEDGMENTS

This report was prepared under the general direction of **Arthur J. Norton**, Assistant Division Chief, Population Division. Assistance with statistical tables and testing was provided by **Gerda K. Mudd**. Sampling review was conducted by **M. Diane Harley**, Statistical Methods Division. Programming of the detailed tables was provided by **Thelma Varhuch**, and survey operations were coordinated by **Kathleen Creighton** in the Demographic Surveys Division. **Campbell J. Gibson**, Demographic Advisor, Population Division, provided comments on portions of the report. **Marion Gordon**, Population Division, helped coordinate prepublication review. The report was edited by **Paula Coupe**, Publications Services Division.

Household and Family Characteristics: March 1983

INTRODUCTION AND HIGHLIGHTS

This annual report presents demographic data on households and families for 1983, and highlights some of the important changes that have occurred in recent years. Changes in the number, composition, and characteristics of households have a substantial impact on the level of demand for a vast array of public and private sector products and services including housing, durable consumer items, food, energy, education, and health care. Consequently, variations in the data from year to year constitute important information for the work of planners and decision makers. Some highlights of the topics discussed in this report are:

- The number of households in 1983, about 83.9 million, did not increase significantly over the number of households in 1982. About 73 percent of all households in 1983 were composed of families, compared with 81 percent in 1970.
- Average household size dropped from 3.33 persons per household in 1964 to 2.73 persons per household in 1981, but there has not been a significant change in the average during the past 2 years.
- One-parent families, as a percentage of all families with children, increased from 11 percent in 1970 to 22 percent in 1983.
- Among all families with children, the proportion of householders that had completed 4 or more years of college in 1983 was 22 percent, compared with 9 percent for female householders maintaining one-parent homes.

Preliminary analysis of these 1983 Current Population Survey data appeared in an advance report issued in July 1983 (Current Population Reports, Series P-20, No. 382). Statistics on age at first marriage, divorce ratios, unmarried couples, and the living arrangements of children and adults are contained in *Marital Status and Living Arrangements: March 1983*, an annual report which uses the person rather than the household as the primary unit of analysis.

All of the data presented in this report are subject to sampling variability since they are not based on a complete census of the population. Caution should be exercised when using estimates based on a small number of cases, particularly if the difference between two numbers being compared is small. For a complete discussion of sampling variability, see Appendix B, "Source and Reliability of the Estimates."

COMPOSITION OF HOUSEHOLDS

According to the results of the Current Population Survey, there were an estimated 83.9 million households in the United States in March 1983. The Census Bureau classification system for households identifies two major types: family and nonfamily. By Census Bureau definition, a family household requires the presence of a householder (a person who owns or rents the living quarters) and at least one other person related to the householder by birth, marriage, or adoption. In a nonfamily household, the householder either lives alone or has no relatives living with him or her.

Family households. About 61.4 million households, or 73 percent of all households, were composed of families in 1983 (table A). Examples of the variety of family household possibilities include a married couple living in their own apartment, a woman and her child living by themselves, or a person sharing a home with an elderly parent.

The Census Bureau identifies three basic types of family households: married-couple families, other families with male householder (no wife present), and other families with female householder (no husband present). A majority of all households in 1983 (about 60 percent) were maintained by married couples, whereas only 2 percent were other families with male householders and 11 percent were other families with female householders.

Nonfamily households. There were 22.5 million nonfamily households in 1983, representing 27 percent of all households. Examples of the various nonfamily living arrangements include a person living alone, an unmarried couple with no children, or three unrelated college students sharing an apartment.

Male nonfamily householders accounted for 11 percent of households, while female nonfamily householders represented 16 percent of all households. Persons living alone, all of whom are nonfamily householders by definition, constituted 85 percent of the nonfamily householders and 23 percent of all households.

Another perspective on household composition emerges from analysis of the distribution of persons in households rather than the distribution of the households. For example, although 27 percent of households were nonfamily households, they contained only 12 percent of the 229.2 million persons living in households in 1983. Similarly, while

Table A. Households and Persons, by Type of Household and Presence of Children: 1983

(Numbers in thousands)

Type of household	Households		Persons in households		Persons per household
	Number	Percent	Number	Percent	
Total households	83,918	100.0	229,178	100.0	2.73

Without own children under 18	30,575	36.4	78,087	34.1	2.55
Married-couple family	49,908	59.5	166,854	72.8	3.34
With own children under 18	24,363	29.0	103,368	45.1	4.24
Without own children under 18	25,544	30.4	63,486	27.7	2.49
Other family, male householder	2,016	2.4	5,765	2.5	2.86
With own children under 18	737	0.9	2,200	1.0	2.99
Without own children under 18	1,279	1.5	3,565	1.6	2.79
Other family, female householder	9,469	11.3	29,571	12.9	3.12
With own children under 18	5,718	6.8	18,535	8.1	3.24
Without own children under 18	3,751	4.5	11,036	4.8	2.94
Nonfamily households	22,525	26.8	26,988	11.8	1.20
Living alone	19,250	22.9	19,250	8.4	1.00
Male householder	9,514	11.3	12,426	5.4	1.31
Living alone	7,451	8.9	7,451	3.3	1.00
Female householder	13,011	15.5	14,562	6.4	1.12
Living alone	11,799	14.1	11,799	5.1	1.00

persons living alone represented 23 percent of all households, they were just 8 percent of the total household population.

About 88 percent of the household population lives in a family household, 73 percent in a married-couple family, 45 percent in a household where children and both parents are present, and 9 percent in one-parent households where either the father or mother (usually the father) was absent (table A). Although individuals will experience a variety of living arrangements during their lives, 103.4 million persons were living in families in March 1983 that included a husband, wife and children.

Racial and ethnic differences. Black households are just as likely as White households to be composed of families—73 percent of the total in both groups. A much higher percentage of White households than Black households, however, were married-couple families (62 percent versus 39 percent). Among Black households, 31 percent were families maintained by a a woman alone, compared with 9 percent of White households. Black households were also more likely to include own childen than were White households, 44 percent and 36 percent, respectively (table B).

Table B. Households, by Type, Presence of Children, and Race and Spanish Origin of Householder: 1983

(Numbers in thousands)

Type of household	White		Black		Other races		Spanish origin[1]

Living alone	10,529	14.4	1,120	12.6	150	8.2	313	7.7

[1] Persons of Spanish origin may be of any race.

About 83 percent of households maintained by persons of Spanish origin were families, and 57 percent of Spanish-origin households included children. These were higher proportions than those found among households overall. Women maintaining families (where husbands were not present) represented 19 percent of Spanish-origin households, a proportion that was significantly higher than that for all households, but which was lower than that for Black households. Only 14 percent of Spanish-origin households contained persons who lived alone, compared with 23 percent of households in general (tables A and B).

CHANGE IN HOUSEHOLD FORMATION PATTERNS

Between 1970 and 1980, the net annual increase in the number of households averaged about 1.6 million per year, compared with 1.0 million per year for the period since 1980 (table C). While there was a difference of 391,000 between the household estimates for 1982 and 1983, this difference is not statistically significant. The fact that the number of households did not change significantly since 1982 is a new development, but it would be premature to draw conclusions about altered trends on the basis of the 1983 data alone. It is becoming evident, however, that the level of annual household increase experienced thus far during the 1980's is falling below the level for the 1970's.

Table C. Average Annual Changes in the Numbers of Households, by Type: 1970 to 1980 and 1980 to 1983

55 years and over....	-22	116	200

Note: 1970-80 changes based on 1970 census population controls; 1980-83 changes based on 1980 census population controls.

Family households increased by an average of 697,000 per year between 1970 and 1980, and the average since 1980 has not been significantly different (614,000 per year). Nonfamily households, by contrast, were increasing at an average of 874,000 per year between 1970 and 1980, but since 1980 the level of increase has been much lower (433,000 per year) than during the earlier period.

Among family households, there has been a striking turnaround in the number of married-couple families maintained by persons under 35 years old. During the 1970's these comparatively youthful households were increasing at an average of 147,000 annually. Since 1980, the number has not increased, but rather has actually declined by an average of 220,000 households per year. There has been a similar change among families maintained by female householders under 35 years of age. These households increased by 162,000 per year during the 1970-80 period, compared with only 52,000 per year since 1980.

As with family households, much of the drop in the level of annual increase in nonfamily households is attributable to householders under the age of 35. Like nonfamily householders generally, most of those under 35 were persons living alone. Male nonfamily householders under 35 years old were increasing by 305,000 per year between 1970 and 1980, but there has been no significant annual increase in the number of these households since 1980. Much the same was true of the corresponding group of female householders. Those under 35 years old increased by 184,000 per year during the 1970-80 period, but the number did not increase significantly during the 1980-83 period.

In summary, the fact that the average net annual increase in households has been lower over the past 3 years than during the previous decade is to some extent due to the downward pressure being exerted by a drop in the proportion of younger adults forming households. The large number of persons born during the "baby boom" (those now roughly 20 to 35 years of age) are at the prime ages when they would be expected to begin to form households at a high rate. Since the pool of young adults available to become householders has not declined, the change in household formation patterns since 1980 seems more likely to be a response to economic conditions that may have discouraged the formation of new households, particularly among young adults. It is also possible that changes in the social climate have influenced the lower level of household formation experienced since 1980. For example, divorce rates have stabilized, more adult sons and daughters appear to be living with their parents, and many young adults are postponing marriage as they pursue educational and career goals.

SELECTED CHARACTERISTICS OF HOUSEHOLDS

Age of householder. The median age of persons maintaining households was 45.9 years in 1983 (table D). Those main-

[1] Persons of Spanish origin may be of any race.

taining family households tended to be significantly younger (median age 44.5) than those maintaining nonfamily households (median age 54.3). Female nonfamily householders were generally older (median age 64.3) than male nonfamily householders (median age 38.1). This age difference is largely due to the fact that a sizable number of older women—generally widows—who live alone are included among female nonfamily householders, whereas many of the male nonfamily householders are young men who have left their childhood homes, but have not yet formed families of their own.

Marital status. Slightly under two-thirds of households in 1983 were maintained by married persons. About 60 percent of households were maintained by persons living with their spouses and an additional 5 percent were maintained by married persons whose spouses were absent on a nontemporary basis and residing elsewhere because of such things as legal separations, service in the Armed Forces, or jobs in distant cities. Approximately 13 percent of householders were widowed, 11 percent were divorced, and 12 percent had never been married.

Only 7 percent of all family households were maintained by divorced persons, whereas about 21 percent of nonfamily households were maintained by divorced persons. A higher proportion of male than female nonfamily householders were divorced, 26 percent and 17 percent, respectively.

Size of household. The average number of persons per household began to decline during the mid-1960's, with average household size dropping from 3.33 persons in 1964[1] to 2.73 persons in 1981. There has not been a statistically significant change in average household size over the past 2 years, with the average in 1983 standing at 2.73 persons.

About 23 percent of households contain one person, 32 percent two persons, 18 percent three persons, 16 percent four persons, and 12 percent five persons or more. Households of two persons were most common among family households, whereas 6 out of 7 nonfamily households were one-person households. The overall average size of family households was 3.29 persons, whereas nonfamily households averaged 1.20 persons.

Presence of children. There were 30.8 million households in 1983 that included own children (i.e., the householder's never-married children under 18 years old living at home), which constituted 37 percent of all households. Children were present in 50 percent of family households. The type of family most likely to include a child was one that was maintained by a woman whose husband was not present (60 percent had children), followed by married-couple families (49 percent), and families maintained by a man with no wife present (37 percent). Overall, about 56 percent of those families not maintained by a married couple were one-parent family households.

Nonrelatives in household. Roommates, boarders, live-in employees, and other persons not related to the householder were present in approximately 5 percent of all households in 1983. Only 849,000 households, or 1 percent of all householders, had more than one nonrelative in residence. Nonrelatives were more likely to be present in nonfamily households than family households, with 2 percent of family households versus 15 percent of nonfamily households including one or more nonrelatives. Unmarried couples and group households shared by two to nine persons unrelated to one another are counted among those households containing nonrelatives. Living arrangements with nine or more persons unrelated to the person in charge are defined as group quarters, and would not be included in the count of households.

Tenure. About 65 percent of all householders were owners, according to the 1983 survey. The percentage for family householders who were owners (72 percent), was significantly higher than that for nonfamily householders (45 percent). A low proportion of nonfamily households maintained by men (37 percent) were owners. By contrast, a comparatively high proportion of married-couple families (78 percent) were owners.

ONE-PARENT FAMILIES

There were 31.2 million families with children under 18 in 1983. One-parent families accounted for almost 22 percent of those families with children. Although unrelated subfamilies have not been included in the count of families since 1980, they are included in these totals to allow consistent comparison with 1970 data. The proportion of one-parent families has almost doubled since 1970 when 11 percent of families with children were maintained by one parent (table E).

A one-parent family may come about when a person who has never married has a child, when a married couple with a child separates or divorces, or when a parent is widowed. The major contributors to the increase in the number of one-parent families since 1970 have been divorce and separation, along with the rise in the number of never-married parents. Widowed parents did not contribute to the increase, but rather have declined in number since 1970.

The total number of families with children increased by 8 percent between 1970 and 1983. During that same period, however, two-parent families declined by 5 percent, while one-parent families were up by 107 percent. This dramatic increase in one-parent families has been one of the most important changes in family composition over the past 10 to 15 years, but there are indications that the trend may be changing. After increasing by an average of 308,000 per year between 1970 and 1980, there was no significant change in the number of one-parent families between 1982 and 1983. Since changes over 1-year periods are not sufficient bases for establishing new trends, more data will be needed to see whether or not new patterns have developed.

One-parent families are maintained by the mother in the vast majority of cases (89 percent). This was true in both

[1] Although unrelated subfamilies (i.e., secondary families) have not been included in the count of families since 1980, they are included in these totals along with family households (i.e., primary families) to allow consistent comparison with 1970 data.

1970 and 1983. Although there are now many more fathers maintaining families alone than in the past (747,000 in 1983 versus 345,000 in 1970), the corresponding number for mothers has also increased substantially (6.0 million in 1983 versus 2.9 million in 1970).

There are considerable differences between Blacks and Whites in the incidence of one-parent families. In 1983, more than half of Black families with children (52 percent) were maintained by one parent as compared with about 1 of every 6 White families with children (17 percent). The incidence of one-parent families has increased among both Blacks and Whites over the past 13 years. In 1970, about 33 percent of Black families with children were one-parent situations, compared with 9 percent among White families. Despite the high incidence of one-parent families among Blacks, 67 percent of the 6.8 million one-parent families in 1983 were maintained by White mothers or fathers. The corresponding proportion in 1970 was slightly higher (69 percent). All of these numbers on one-parent families are based on the reported living arrangements of the parents and children involved at the time of the survey, and do not provide explicit indications of child custody as determined by local courts.

YEARS OF SCHOOL COMPLETED BY FAMILY HOUSEHOLDERS

About 15 percent of the 61.4 million family householders had completed no more than 8 years of school in 1983, 14 percent had completed 1 to 3 years of high school, 36 percent had 4 years of high school, 16 percent had 1 to 3 years of college, and 20 percent had completed 4 or more years of college (table F). The percentage completing 4 or more years of high school was higher among the 30.8 million householders with children under 18 than among family householders overall.

Approximately 73 percent of White family householders had completed at least 4 years of high school, and 21 percent had completed 4 or more years of college. By contrast, among Black family householders, 56 percent had at least 4 years of high school, and only 8 percent had completed 4 years of college or more.

There were 9.5 million families maintained by women in 1983, and about 60 percent of these families included one or more of the householder's never-married children under age 18. Roughly 11 percent of the 5.7 million women maintaining families where own children were present had fewer than 9 years of school, 21 percent had 1 to 3 years of high school, and 9 percent had 4 or more years of college. Thus, when female householders are compared with family householders overall (in homes where children were present), the percentage of female householders who were not high school graduates was much higher (31 percent versus 22 percent), and the percentage of college graduates was much lower (9 percent versus 22 percent).

Among White female householders with own children under 18 years old but no husbands present, 28 percent had not completed high school as compared with 20 percent of all White householders maintaining families with children. For the corresponding group of Black women maintaining families with children present, the proportion that had not completed high school (38 percent) was only slightly higher than the proportion of all Black householders with children (35 percent).

HOMEOWNERSHIP

Almost two-thirds of householders in 1983 owned (or were buying rather than renting) their homes. The proportion of householders that are owners tends to go up as the age of

householders increases to age 65, when living arrangements change and the proportion declines. Only 10 percent of householders 15 to 19 years old were owners (table G), but in the 30-to-34 age group well over half (56 percent) were homeowners. The proportion of owners was 81 percent for 55-to-64-year-old householders, 77 percent for the 65-to-74 age group, and 72 percent for those aged 75 years and over.

Tenure data on owners and renters have been tabulated in the Current Population Survey since 1976. Ownership estimates published in this series for the years 1970-82 were probably somewhat too high, particularly toward the end of the period because of the computer procedure used for handling cases where the necessary data were not supplied on the interview questionnaire. A technical revision to the system for imputing missing tenure information was used on the 1982 data and indicates that the homeownership rate originally published for that year (67 percent) was overstated by 2 to 3 percentage points. The revised homeownership rate for 1982 (65 percent) was not significantly different from the 1983 figure.

The level of homeownership in the United States remains higher than that registered during the past decade for many large industrialized nations such as Canada (64 percent in 1981), Japan (58 percent in 1970), United Kingdom (50 percent in 1971), France (47 percent in 1978), Sweden (39 percent in 1975), and the Federal Republic of Germany (36 percent in 1978).[2]

RELATED REPORTS

Data for 1983 and earlier years on households and families by type were published in Series P-20, No. 382, *Households, Families, Marital Status, and Living Arrangements: March 1983 (Advance Report).* Figures for 1983 on the sex, age, marital status, and living arrangements of persons appear in Series P-20, *Marital Status and Living Arrangements: March 1983.* Projections for the United States of the number of households and families from 1979 to 1995 have been published in Series P-25, No. 805. More comprehensive information on married couples was published in 1978 in Series P-23, No. 77, *Perspectives on American Husbands and Wives.* Results of a study on the marital history of men and women are provided in Series P-20, No. 297, *Number, Timing, and Duration of Marriages and Divorces in the United States: June 1975* and Series P-20, No. 312, *Marriage, Divorce, Widowhood, and Remarriage by Family Characteristics: June 1975.* Statistics on the characteristics of families maintained by women were presented in Series P-23, No. 107, *Families Maintained by Female Householders, 1970-79.* Statistics on households, families, and related subjects for 1980 for standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are presented in 1980 Census of Population, Volume 1, *Characteristics of the Population,* Chapters B, C, and D.

Appendix A. Definitions and Explanations

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 881,000 members of the Armed Forces in the United States living off post or with their families on post in 1983 but excludes all other members of the Armed Forces.

Symbols. A dash (–) represents zero or rounds to zero. The symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Age. The age classification is based on the age of the person at the person's last birthday. The adult universe (i.e., population of marriageable age) is now comprised of persons 15 years old and over. Prior to 1980 the adult universe was 14 years old and over.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

Marital status. The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structures and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. As of 1983 group quarters were defined in the Current Population Survey as noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing nine or more persons (or prior to 1983 five or more persons) unrelated to the person in charge. Since 1972, inmates of institutions have not been included in the Current Population Survey.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the householder in married couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head." The householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members is to be recorded.

Family. A family is a group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family household. A family household is a household maintained by a family (as defined above), and any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there are included. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of family.)

Subfamily. A related subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the person or couple who maintains the household. The most common example of a related subfamily is a young married couple sharing the home of the husband's or wife's parents. The number of related subfamilies is not included in the count of families.

Unrelated subfamily. An unrelated subfamily (formerly called a secondary family) is a group of two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. The unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. The number of married couples equals the count of married-couple families plus related and unrelated married-couple subfamilies.

Unrelated individuals. Unrelated individuals are persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Nonfamily householder. A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Secondary individual. A secondary individual is a person in a household or group quarters such as a guest, roomer, boarder, or resident employee (excluding nonfamily householders and inmates of institutions) who is not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

Size of household, family, or subfamily. The term "size of household" includes all persons occupying a housing unit. "Size of family" includes the family householder and all other persons in the living quarters who are related to the householder by birth, marriage, or adoption. "Size of related subfamily" includes the husband and wife or the lone parent and their never-married sons and daughters under 18 years of age. "Size of unrelated subfamily" includes the reference person and all other members related to the reference person. If a family has a related subfamily among its members, the size of the family includes the members of the related subfamily.

Related persons and family members. In the classification of households by number of related persons, the person or couple who maintains the household or (housing unit) and all persons in the household related to them are included. In the classification of families by number of family members, all persons in the family are included. The number of family members is the same as the size of the family.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the householder. Similarly, "own" children in a subfamily are sons and daughters of the married couple or parent in the subfamily. (All children shown as members of related subfamilies are own children of the person(s) maintaining the subfamily.) "Related" children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25" and "own children of any age," as the terms are used here, include all children regardless of marital status. The totals include never-married children living away from home in college dormitories.

The count of related children in families was formerly restricted to single (never married) children. However, beginning with data for 1968 the Bureau of the Census includes ever-married children under the category of related children. This change added approximately 20,000 children to the category of related children in March 1968.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Units in structure. In the determination of the number of units in a structure, all housing units, both occupied and vacant, were counted. The statistics are presented in terms of the number of occupied housing units in structures of specified size, not in terms of the number of residential structures.

Years of school completed. In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force and employment status. The definitions of labor force and employment status in this report related to the population 15 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register, (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntary idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation. The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

In 1980, the Bureau of the Census revised the Standard Occupational Classification System (SOC) for use in its tabulation program for the 1980 census and subsequent published reports on occupational data. Consequently, the new classification system was incorporated into the CPS tabulation program in January 1983. While the new system provides comparability between the CPS and other data sources, it causes a break in continuity for all CPS series containing occupational data.

Differences between the 1970 and 1980 occupational systems affect classifications at all levels. Such commonly used identifiers as white-collar, blue-collar, professional and technical, craft workers, and operative occupations have been eliminated. These identifiers have been replaced with new categories which represent conceptual as well as language changes. Moreover, many of the components of the former groupings have been shifted to such an extent that they cannot be made to correspond readily to the new categories. For a more complete explanation and description of the changes from the old to new occupational classification system see the February 1983 issue of "Employment and Earnings" by the Bureau of Labor Statistics.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central county. In New England SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Income. Data on income cover money income only, prior to deduction for taxes, received from such sources as wages or salaries, net income from self-employment, Social Security, dividends, interest, public assistance and welfare, unemployment compensation, government pensions, and veterans payments. Certain money receipts such as capital gains are not included. For a more detailed explanation, see Bureau of the Census, Current Population Reports, Series P-60.

Appendix B. Source and Reliability of Estimates

Source of Data

The estimates in this report are based on data obtained from the Current Population Survey (CPS) of the Bureau of the Census. The CPS estimates are based on data obtained in March of 1970, 1980, 1982 and 1983. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in every sample household. In addition, supplementary questions are asked every March about household and family characteristics. In order to obtain more reliable data for the Spanish-origin population, the March CPS sample was enlarged to include all households from the previous November sample which contained at least one sample person of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are included.

The present CPS sample was initially selected from the 1970 census files with coverage in all 50 states and the District of Columbia. The sample is continually updated to reflect new construction. The current CPS sample is located in 629 areas comprising 1,148 counties, independent cities, and minor civil divisions in the Nation. In this sample, approximately 61,500 occupied households were eligible for interview. Of this number, about 2,500 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason.

The table below provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces.

Description of March Current Population Survey

Time period	Number of sample areas[1]	Housing units eligible	
		Interviewed	Not interviewed
1982 to 1983..	629	59,000	2,500
1980..........	629	65,500	3,000
1970..........	449	48,000	2,000

[1] These areas were chosen to provide coverage in each State and the District of Columbia.

The independent population estimates used in this report to obtain data for March 1980 and later are based on the 1980 decennial census. Data for 1970 were obtained using independent population estimates based on the 1970 decennial census. The estimation procedure for the data also involved a further adjustment so that husband and wife of a household receive the same weight.

Reliability of Estimates

Since the estimates in these tabulations are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaire, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of the respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, compared with the level of the 1980 decennial census, is about 7 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for

Black and other races combined than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the decennial census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper No. 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper No. 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

Comparability with other data. Caution should be used when comparing estimates for 1980 and later, which reflect 1980 census-based population controls, to that for 1970, which reflect 1970 census-based population controls. This change in population controls had relatively little impact on summary measures such as means, medians, and percent distributions, but did have a significant impact on levels. For example, use of the 1980-based population controls resulted in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for 1980 and later will differ from those for earlier years by more than what could be attributed to actual changes in the population and these differences could be disproportionately greater for certain subpopulation groups than for the total population.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals, ranges that would include the average result of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 68 percent of the intervals from one standard error below the estimate to one standard error above the estimate would include the average result of all possible samples.

2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

3. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common types of hypotheses are 1) the population parameters are identical or 2) they are different. An example of this would be comparing the average size of households maintained by male householders versus that maintained by female householders. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the parameters are different when, in fact, they are identical.

All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between parameters is greater than twice the standard error of difference. For the other differences mentioned, the estimated difference between parameters is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison will be qualified in some way; e.g., by use of the phrase "some evidence."

Note when using small estimates. Summary measures (such as averages and percent distribution) are shown when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for the corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's need.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures in tables B-1 and B-2 provide approximations to standard errors of estimated numbers and estimated percentages. Estimated standard errors for specific characteristics cannot be obtained from tables B-1 and B-2 without the use of factors in table B-3. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and

Table B-1. Standard Errors of Estimated Numbers

Size of estimate	Standard error
25	9
50	13
100	19
250	30
500	42
1,000	59
2,500	93
5,000	131
10,000	182
15,000	221
25,000	277
50,000	364
100,000	424

Note: For a particular characteristic see table B-3 for the appropriate factor to apply to the above standard errors.

estimating procedure on the value of the characteristic. Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation. The factors for all household members should be used for characteristics pertaining to all persons in a household. For characteristics which include only some household members, such as "children under 18 years of age," the factor for some household members should be used.

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table B-4. These parameters were used to calculate the standard errors in tables B-1 and B-2, and to calculate the factors in table B-3. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Methods for direct computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard er[illegible] σ_x, of an estimated number can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \qquad (1)$$

where f is the appropriate factor from table B-3, and σ is the standard error on the estimate obtained by interpolation from table B-1. Alternatively, standard errors may be approximated by using formula (2), from which the standard errors were calculated in table B-1. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_x = \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate and a and b are the parameters in table B-4 associated with the particular type of characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the factor or set of parameters for the characteristic which will give the largest standard error.

Illustration of the computation of the standard error of an estimated number. Table A of this report shows that in 1983 there were 22,525,000 nonfamily households. Using formula (2) with a = −0.000010 and b = 1389 from table B-4, the approximate standard error[1] is

$$\sqrt{(-0.000010)(22{,}525{,}000)^2 + (1{,}389)(22{,}525{,}000)} \doteq 162{,}000$$

The 68-percent confidence interval for the number of nonfamily households is from 22,363,000 to 22,687,000. The 95-percent confidence interval is from 22,201,000 to 22,849,000 (using twice the standard error). Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator

Table B-2. Standard Errors of Estimated Percentages

Base of estimated percentage (thousands)	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.1	3.0	4.7	6.5	9.4	10.8
100	1.9	2.6	4.1	5.6	8.1	9.4
250	1.2	1.7	2.6	3.5	5.1	5.9
500	0.8	1.2	1.8	2.5	3.6	4.2
1,000	0.6	0.8	1.3	1.8	2.6	3.0
2,5000	0.4	0.5	0.8	1.1	1.6	1.9
5,000	0.3	0.4	0.6	0.8	1.1	1.3
10,000	0.2	0.3	0.4	0.6	0.8	0.9
15,000	0.15	0.2	0.3	0.5	0.7	0.8
25,000	0.12	0.2	0.3	0.4	0.5	0.6
50,000	0.08	0.12	0.2	0.3	0.4	0.4
100,000	0.06	0.08	0.13	0.2	0.3	0.3

Note: For a particular characteristic see table B-3 for the appropriate factor to apply to the above standard errors.

---

[1] Using formula (1), table B-1 and the appropriate factor from table B-3, the approximate standard error is 0.63 x 263,000 = 166,000.

Table B-3. Factors to be Applied to Generalized Standard Errors in Tables B-1 and B-2

Characteristic	Persons						Families and unrelated individuals, households, or householders		
	Some household members and secondary individuals			All household members					
	Total or White	Black	Spanish origin	Total or White	Black	Spanish origin	Total or White	Black	Spanish origin
Total or Nonfarm:									
Total, regional or metropolitan.	1.00	1.20	1.13	1.10	1.45	1.60	0.63	0.60	0.64

Education and tenure............	(X)	(X)	(X)	(X)	(X)	(X)	0.63	0.69	0.64
Employment status and occupation	(X)	(X)	(X)	(X)	(X)	(X)	0.76	0.76	[1]0.73
Farm............................	1.38	1.66	1.56	1.52	2.01	2.21	0.85	0.81	0.86

(X) Not applicable.

[1] Apply this factor to table B-2 to obtain standard errors of estimated percentages; for standard errors of estimated levels, use a = 0.000481, b = 1096, and formula (2).

of the percentage are in different categories, use the factor or parameters from table B-3 or B-4 indicated hy the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \qquad (3)$$

In this formula, f is the appropriate factor from table B-3, and σ is the standard error on the estimate from table B-2. Alternatively, standard errors may be approximated by using formula (4), from which standard errors in table B-2 were calculated; direct computation will give more accurate results than use of formula (3).

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} \cdot p(100-p)} \qquad (4)$$

Here x is the size of the subclass of persons, families and unrelated individuals, households, or householders, which is the base of the percentage, p is the percentage $(0<p<100)$ and b is the parameter in table B-4 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of the computation of the standard error of a percentage. Table A shows that of the 83,918,000 households in 1983, 59.5 percent were maintained by married couples. From table B-4, the appropriate b-parameter is 1,389. Using formula (4), the approximate standard error[2] on 59.5 percent is

$$\sqrt{\frac{1{,}389}{83{,}913{,}000}(59.5)(40.5)} \doteq 0.2 \text{ percent}$$

Thus, the 68-percent confidence interval for the percentage of households maintained by married couples in 1983 is from 59.3 to 59.7, and the 95-percent confidence interval is from 59.1 to 59.9.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \qquad (5)$$

where σ_x and σ_y are the standard errors of the estimates x and y; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard errors quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the computation of the standard error of a difference. Table E shows that in 1983, 3,960,000 or 15.1 percent of the 26,273,000 White families with own children under 18 were maintained by the mother. Table E also shows that in 1970, 1,995,000 or 7.8 percent of the 25,543,000 White families with own children under 18 were maintained by the mother. Thus, the apparent difference between the percent of White families with own children under 18 that were maintained by mothers in 1983 and 1970 is 7.3 percent. Using formula (4) and the apppropriate b-parameter, the standard error (σ_x) of 15.1 percent is 0.3 percent. Using the same formula and b parameter, the standard error (σ_y) of 7.8 percent is 0.2 percent. Therefore, using formula (5), the standard error of the estimated difference of 7.3 percent is about

$$\sqrt{(0.3)^2 + (0.2)^2} \doteq 0.4 \text{ percent}$$

This means that the 68-percent confidence interval on the difference between the families with own children under 18 that were maintained by mothers in 1983 and 1970 is from 6.9 to 7.7 percent. The 95-percent confidence interval on the difference of 7.3 percent is from 6.5 to 8.1 percent. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples. Since the interval does not contain zero, we can conclude with 95-percent confidence that the percent of families with own children under 18 that were maintained by mothers in 1983 increased from 1970.

---

[2] Using formula (3), tables B-2 and B-3, the approximate standard error is also 0.2 percent.

Standard error of a ratio. Certain mean values for persons in families or households shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per family or household is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families or households}}{\text{total number of families or households}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families or households of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families or households.

Case 1: There is at least one person having the characteristic in every family or household of the class: as an example, the mean number of persons per family or

[1] Use this parameter to calculate standard errors of estimated percentages only.

[2] Use these parameters to calculate standard errors of estimated levels only.

the mean number of persons per family with a male householder. For ratios of this kind, the standard errors are approximated by the following formula:

$$\sigma_{\frac{x}{y}} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho\left(\frac{\sigma_x}{x}\right)\left(\frac{\sigma_y}{y}\right)\right]} \qquad (6)$$

The standard error of the estimated number of families or households, σ_y, and the standard error of the estimated number of persons with the characteristics in those families or households, σ_x, may be calculated by the methods described above. In formula (6), ρ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above example, and for other ratios of this kind, use 0.7 as an estimate of ρ.

Case 2: The number of persons having the characteristic in a given family or household may be 0, 1, 2, 3, or more: for example, the mean number of persons under 18 years of age per household. For ratios of this kind the standard error is approximated by formula (6), but ρ is assumed to be zero. If ρ is actually positive (negative), then this procedure will provide an overestimate (underestimate) of the standard error of the ratio.

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution.
2. Add to and subtract from 50 percent the standard error determined in step (1).
3. Using the distribution of the characteristic, calculate the 68-percent confidence interval by calculating the values corresponding to the two points established in step (2).
4. Once the limits of the 68-percent confidence interval are computed, the standard error of a median can be computed by the formula:

$$\sigma_{\text{median}} = \frac{U-L}{2}$$

where: U = Upper limit of the 68-percent confidence interval.

L = Lower limit of the 68-percent confidence interval.

Illustration of the computation of a confidence interval for a median. Table D of this report shows that in 1983 the median age of householders in married-couple families was 45.2 years. Table E also indicates the base of the distribution from which this median was determined is 49,908,000 married-couple families.

1. Using formula (4), the standard error of 50 percent on a base of 49,908,000 is about 0.3 percent.

2. To obtain a 68-percent confidence interval on an estimated median, add to and subtract from 50 percent the standard error found in step (1). This yields percent limits of 49.7 and 50.3.

3. From table D, 49.6 percent of the householders in married-couple families were less than 45 years old and 17.2 percent were between 45 and 54 years old. By linear interpolation, the lower limit on the estimate is found to be about

$$45 \text{ years} + (55-45)\left[\frac{49.7-49.6}{17.2}\right] = 45.1 \text{ years}$$

Similarly, the upper limit may be found by linear interpolation to be about

$$45 \text{ years} + (55-45)\left[\frac{50.3-49.6}{17.2}\right] = 45.4 \text{ years}$$

Thus, the 68-percent confidence interval on the median age of married-couple families is from 45.1 to 45.4 years.

4. The standard error of the median is therefore,

$$\frac{45.4-45.1}{2} = 0.2$$

A 95-percent confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step 1. The 95-percent confidence interval on the median age of householders in married-couple families is from 44.9 to 45.6 years.

Value of New Construction Put in Place in the United States 1964 to 1980

CURRENT REVISIONS

This supplement to Construction Reports C30 provides the latest monthly and annual estimates of new construction put in place in the United States for 1964 through 1980.

Revisions have been made to the "farm nonresidential" category beginning in 1964 using data contained in the U.S. Department of Agriculture Report, *Income and Balance Sheet Statistics, 1979.*

New Seasonal factors, based upon monthly revisions through December 1980, were used to revise seasonally adjusted data for 1978 through 1980.

The constant dollar series have been revised to reflect the base year change from 1972 to 1977. **The monthly estimates** are presented at seasonally adjusted annual rates and not seasonally adjusted. Statistics are presented on a 1977 base year for the years 1964 through 1980.

Charts compare current and 1977 constant dollar estimates from 1964 through 1980 for all new construction, public construction, private residential construction, and private nonresidential construction.

Annual statistics on new construction put in place from 1915 through 1964 also appear.
